SERVICE

Studio Design for Next Generation Audio

Dolby Atmos Design, Home Entertainment

Who we are

Studio Sound Service is an acoustic design firm, located in Florence, Italy.
Since 1983 we design rooms for music and audio/video production.

Some Projects:

- Barys Arena (ice hockey) @ Astana, Kazakhstan;
- FOX post-production studios @ München (DE);
- FOX post-production studios @ Hammersmith, London (UK);
- D:POT Recording Arts @ Prato – Fabrizio Simoncioni;
- Mulinetti Studio @ Genova – Alberto Parodi (Resolution Award 2015 Best Audio Facility, Nomination);
- The Garage @ Civitella v.d.C. (AR) (Resolution Award 2014 Best Audio Facility, Nomination);
- House of Glass @ Viareggio (LU) – Gianni Bini (Resolution Award 2013 Best Audio Facility, Nomination);
- Damian Lazarus – Monastic Studio @ Vicchio (FI);
- Vinai Studio @ Brescia;
- Renato Zero Studio @ Roma;
- PPG Studios (Andrea Bocelli) @ S. Pietro Belvedere (PI);
- In House (Dolby® approved - Sorrentino) @ Roma;
- George Lucas Home Theater, Italy;
- Chiesa di Santa Maria Nuova (Arch. Mario Botta) @ Terranuova Bracciolini (AR);
- Prada Auditorium and Conference Room via Orobica @ Milano;
- Sala Proiezioni Museo Ferrari @ Maranello (MO).

Dolby Atmos

 DOLBY.ATMOS

HEAR THE WHOLE PICTURE

Two critical elements significantly improve the audience experience over 5.1 and 7.1 systems:

- A. Sounds originating overhead.
- B. Sounds originating from discrete sources throughout the auditorium.

Audio Objects:
groups of sound elements that share the same physical location in the auditorium

- A. They can be static or move.
- B. Controlled by metadata that details the position of the sound at a given point in time.
- C. When objects are monitored or played back in a theatre, they are rendered according to the positional metadata using the speakers that are present, rather than necessarily being output to a physical channel.

Figure 2.1 Benefits of Increased Surround Resolution for Audio/Visual Coherence

Audio Objects:
groups of sound elements that share the
same physical location in the auditorium

- A. They can be static or move.
- B. Controlled by metadata that details the position of the sound at a given point in time.
- C. When objects are monitored or played back in a theatre, they are rendered according to the positional metadata using the speakers that are present, rather than necessarily being output to a physical channel.

Objects + Beds

While the use of audio objects provides desired control for discrete effects, other aspects of a movie soundtrack do work effectively in a channel-based environment.

- A. beds are channel-based submixes or stems (5.1, 7.1 or 9.1)
- B. e.g. ambient effects or reverberations actually benefit from being fed to arrays of speakers → channels.

Objects + Beds

While the use of audio objects provides desired control for discrete effects, other aspects of a movie soundtrack do work effectively in a channel-based environment.

- A. beds are channel-based submixes or stems (5.1, 7.1 or 9.1)
- B. e.g. ambient effects or reverberations actually benefit from being fed to arrays of speakers → channels.

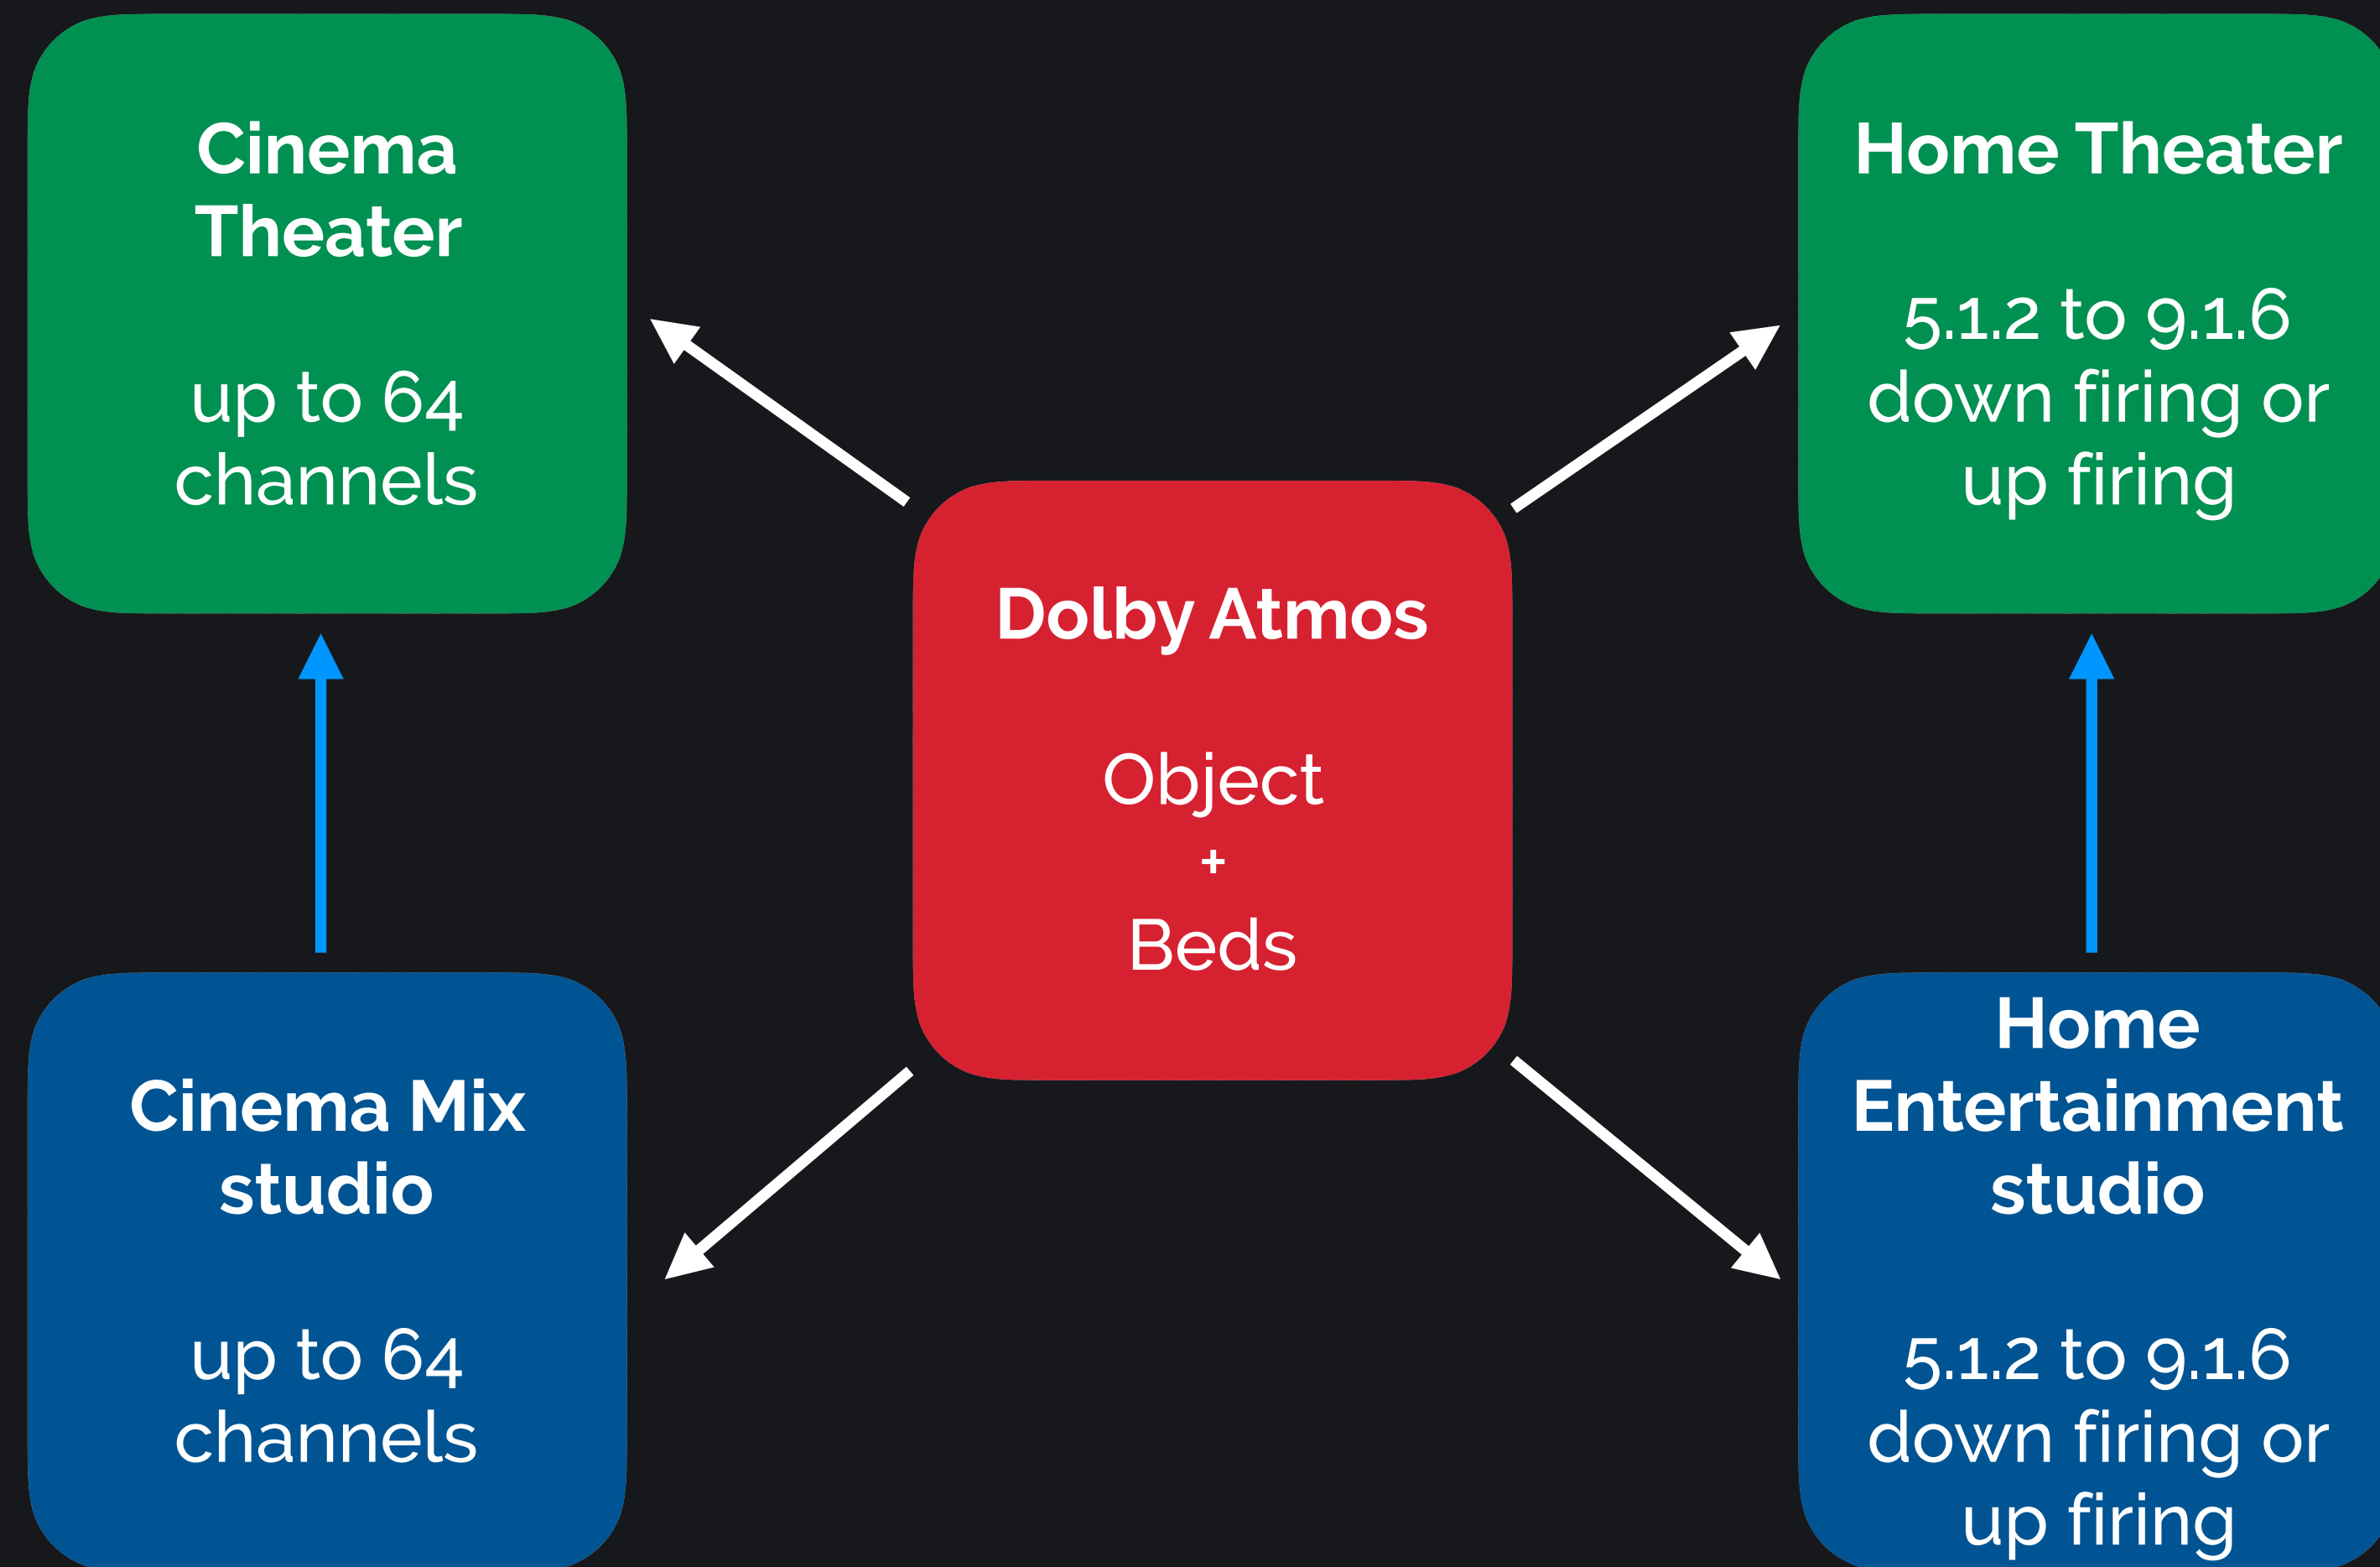

Figure 2.2 Object and Bed Combination

Dolby Atmos architectonic guidelines

- A. Different speaker locations can differ in effectiveness depending on the theatre design.
- B. Dolby Atmos is adaptable and able to playback accurately in a variety of auditoria *(highly flexible configurations)*.
- C. The speakers layout remains compatible with previous cinema systems.
- D. In contrast to using all 64 output channels available, the Dolby Atmos format can be accurately rendered in the cinema to other speaker configurations such as 7.1, allowing the format to be used in existing theatres with no change to amplifiers or speakers.

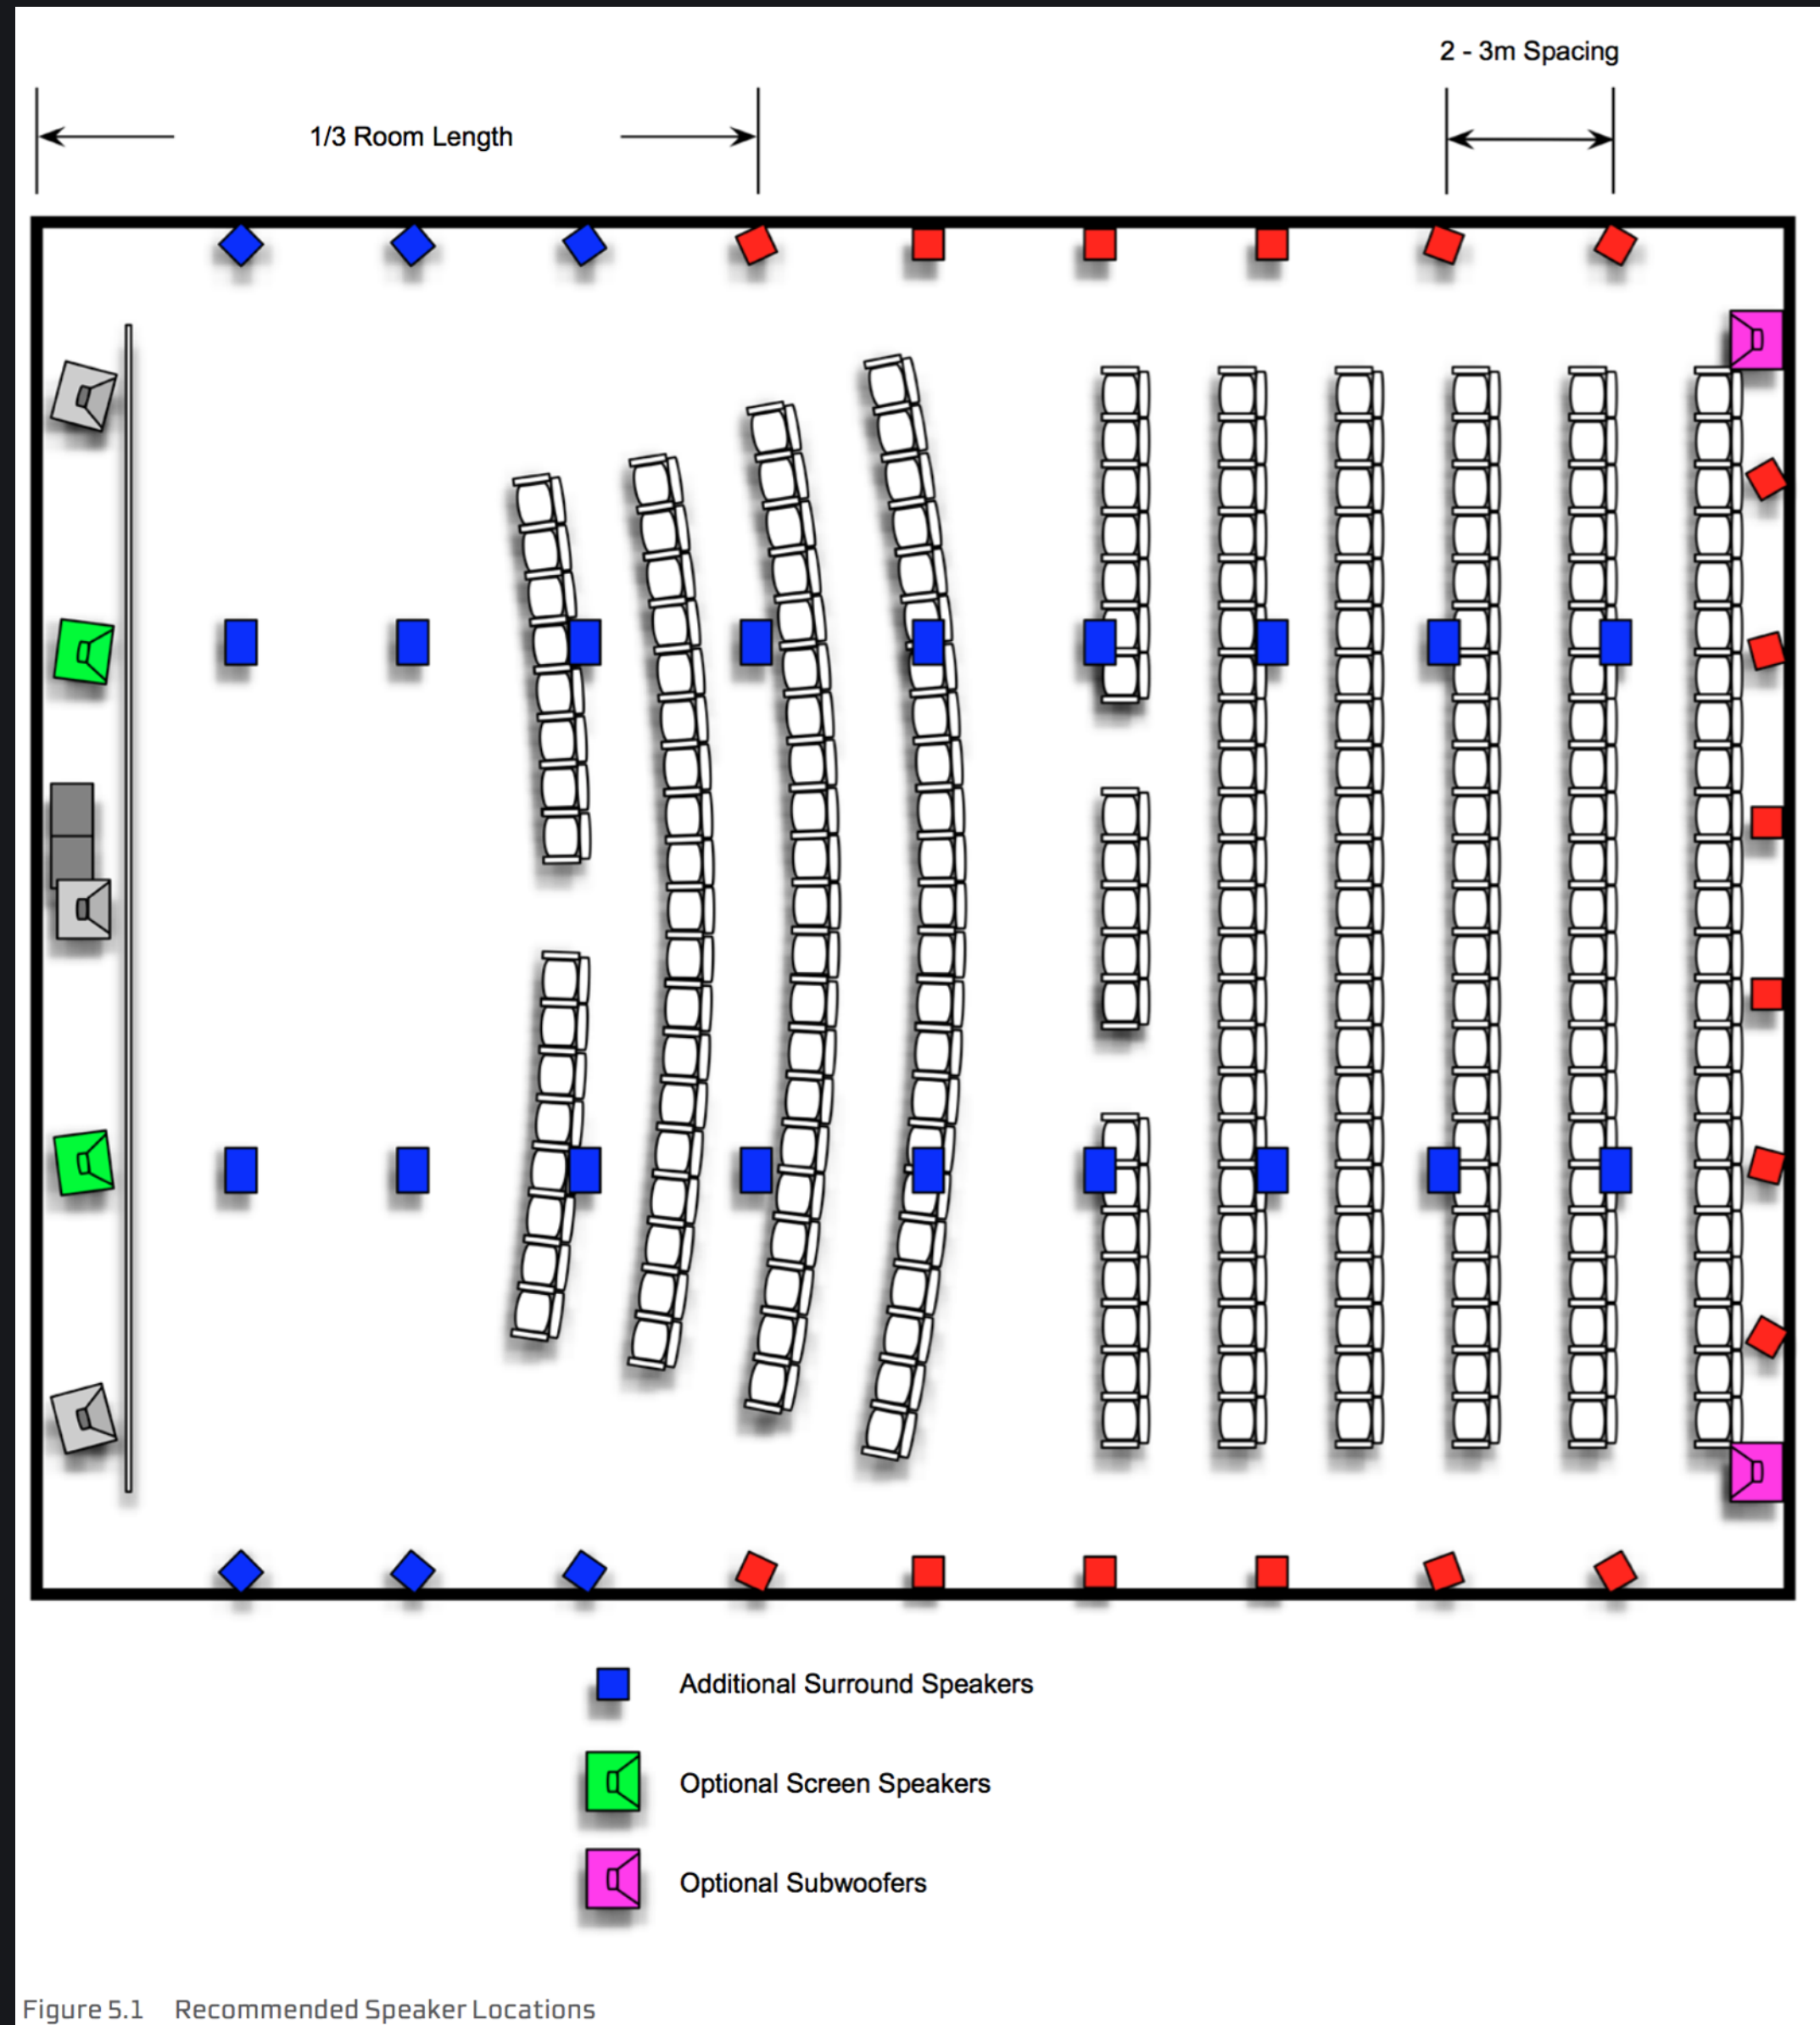

Figure 5.1 Recommended Speaker Locations

Dolby Atmos mixing theater Requirements

- A. Room size > 40 m²
(> 8x5m)
- B. Height > 3.6 m
- C. Adequate loudspeaker power handling
- D. CMA (Critical Mix Area – mixing theater)
vs.
CLA (Central Listening Area – cinema)

 DARDT Excel file from Dolby with specs
(Dolby Atmos Room Design Tool)

1. Listening point

- On the horizontal plan chose and fix the listening point – ideally at $\frac{2}{3}$ of longest dimension – and where additional chairs are going to be placed: you should now be able to estimate how many step you'll need to place for the audience in order to reduce at minimum reciprocal disturbance.

2. Screen Dimensioning & Front Speaker elevation:

- Since front transducer's tweeters must be hidden behind the screen and that Left and Right channels in Dolby Atmos configuration should form a 45° angle together respect the listening point, the maximum screen width is implicitly fixed.

2. Screen Dimensioning & Front Speaker elevation:

- Screen height is then imposed by the image format, which commonly means dividing above chosen screen width by 2,35 – approximately a 16:9.
- Considering listener step and desk height, place then the screen at the minimum height so that that the whole screen is clear from the sweet spot height.
- Elevate front wall/behind the screen monitor acoustic axis at $\frac{2}{3}$ of screen height.

3. Critical Mixing Area:

- Define a rectangular area surrounding the sweet spot where sound quality must be kept optimal:

Theatrical Studio:

$$\text{CMA Area} = (W - 2)/2 * 1 \text{ [m]}$$

Smaller studio (broadcast, HE)

$$\text{CMA Area} = (W - 3)/2 * 0.5 \text{ [m]}$$

4. Side/Rear monitor horizontal plan placing

- On the horizontal plan define three straight line where the acoustic axis of side and rear monitors will be placed.
Mind the fact that since those must be tilted (max 30°) is best to keep some distance from relative closest wall!
- Then, determine mutual distances for the rear and side monitor by drawing two lines 30° separate apart from the center of the of CMA sides: rear monitors are all equally spaced, while side ones could actually be equally spaced from the back till 1/3 of room length and then progressively more spreaded apart.

5. Side/Rear monitor elevation and aiming

Considering a vertical and symmetrical section of the room:

- the acoustic center of the screen is determined by the intersection between the screen itself and the line joining front monitors acoustic axis and the sweet spot;
- all side and rear monitors will then be elevated at heights lying on the line joining screen acoustic center to the $\frac{2}{3}$ back wall heights.

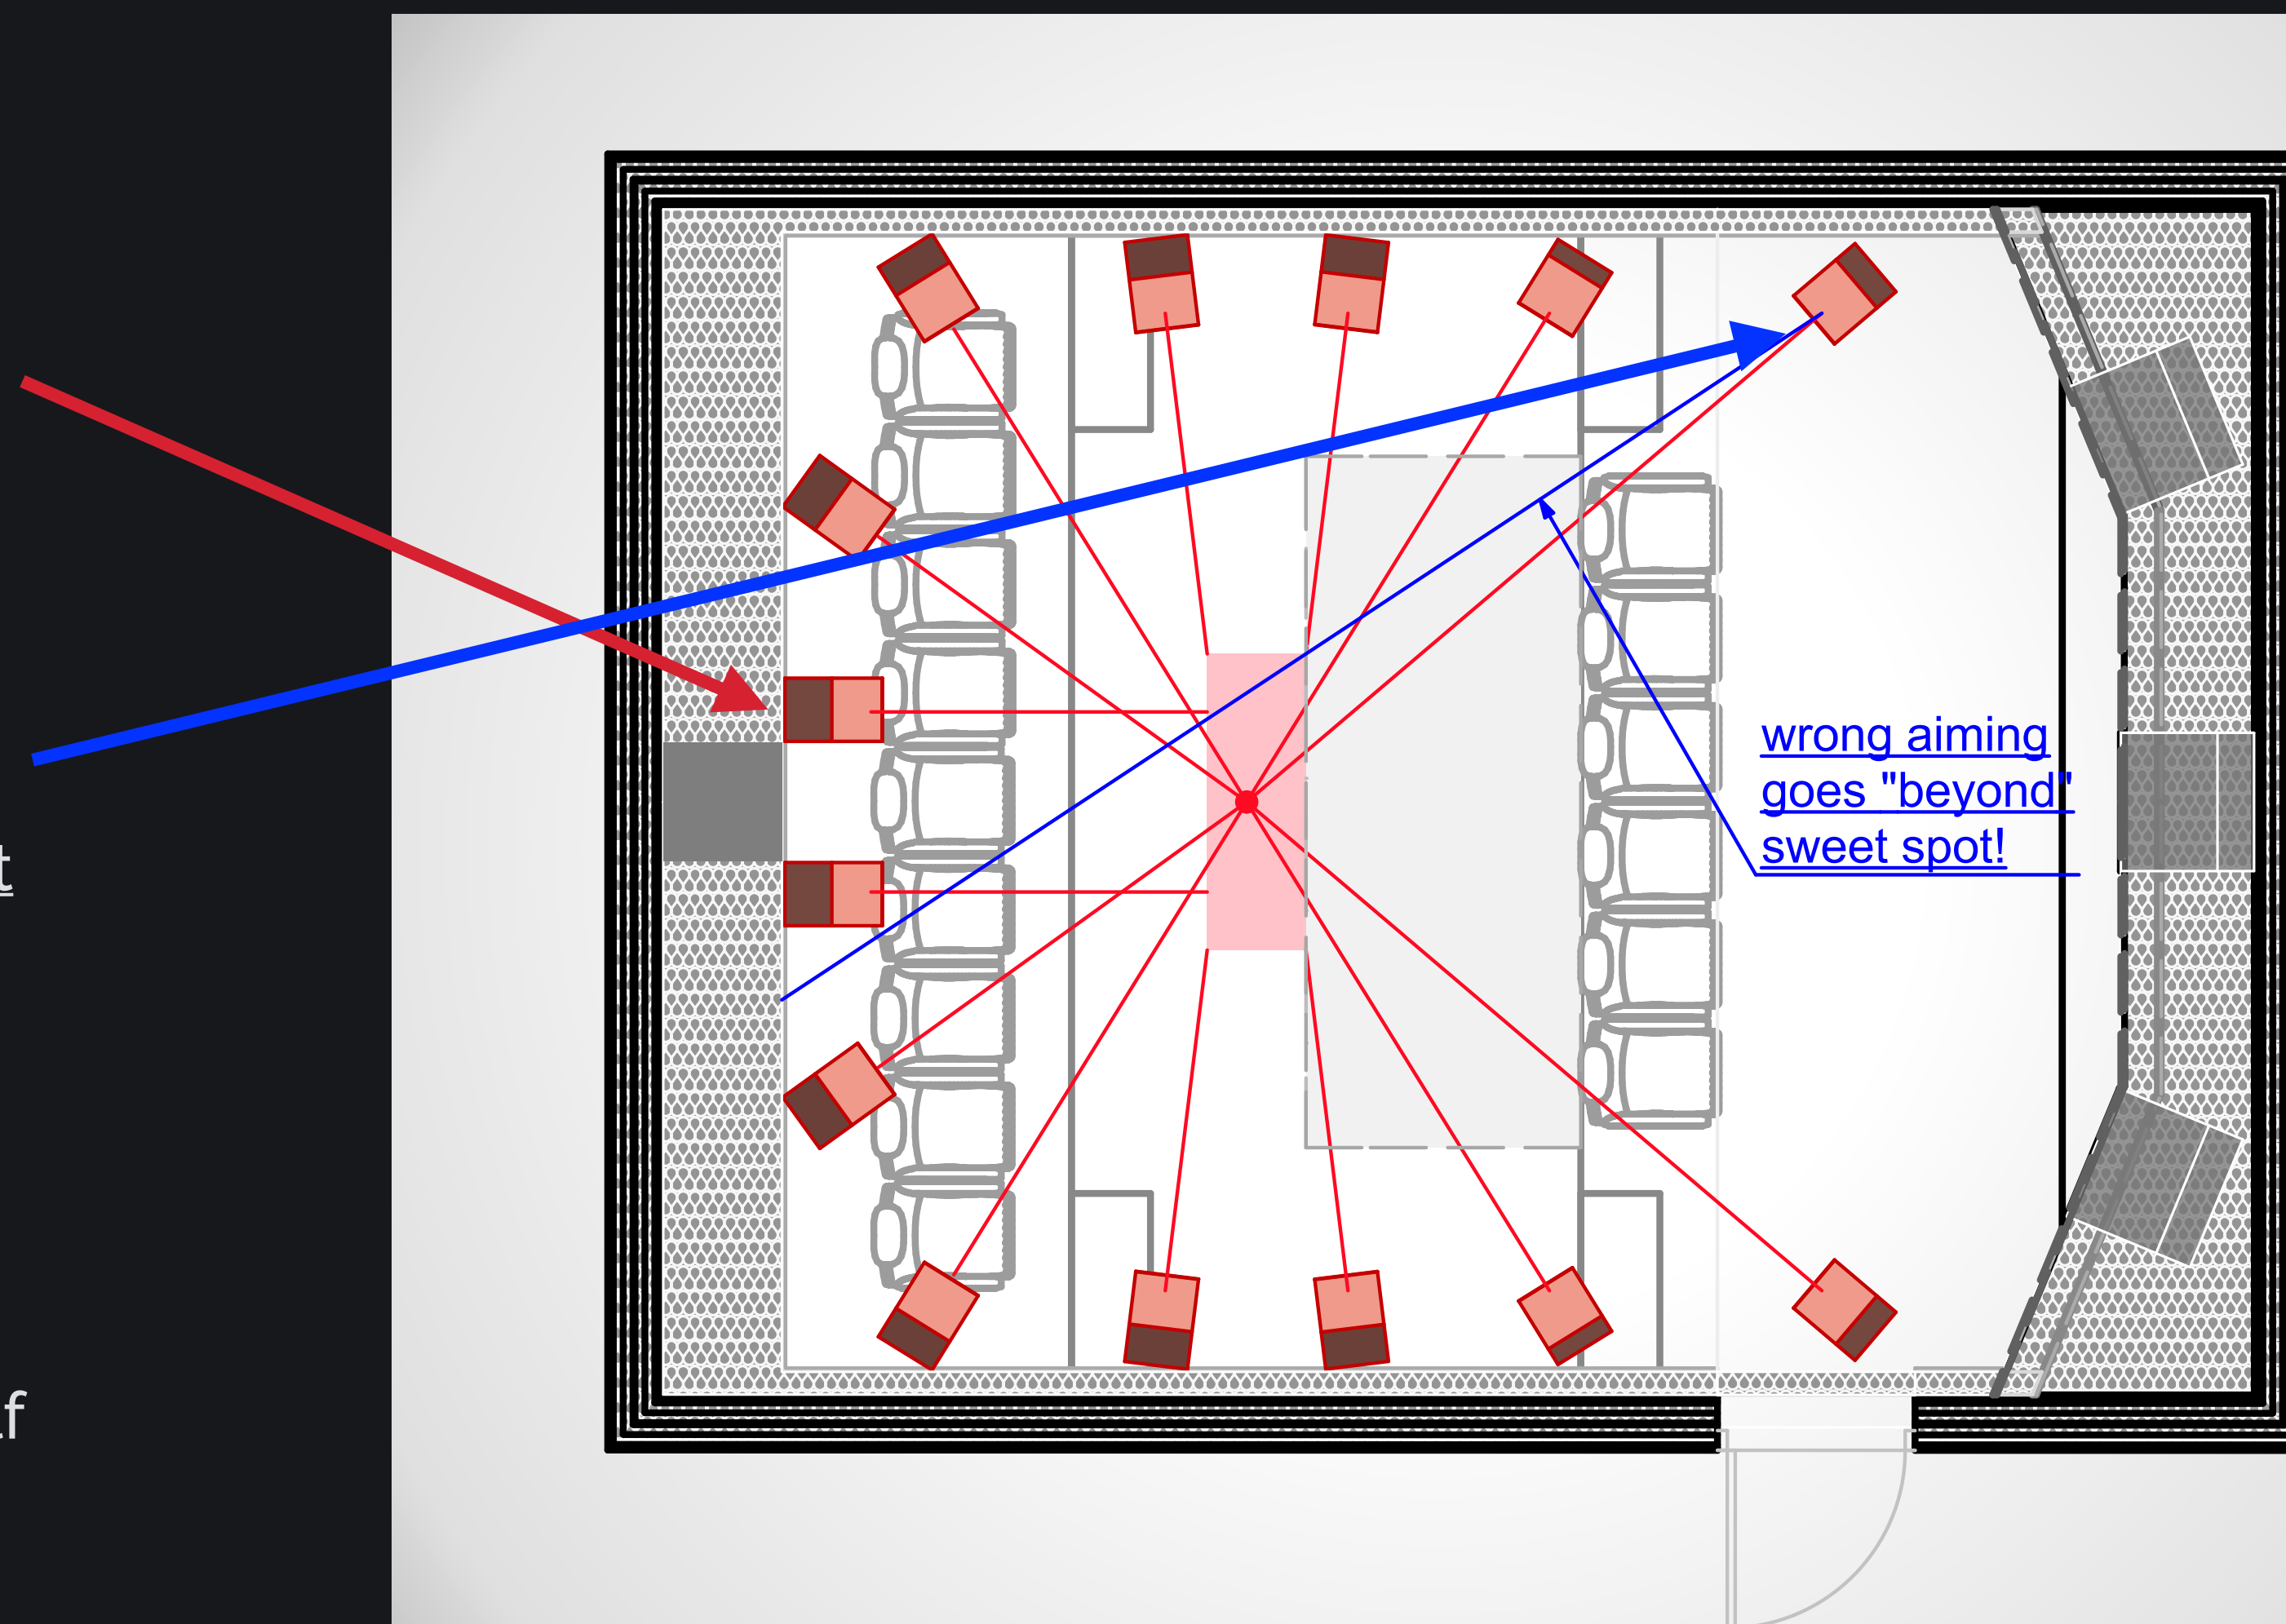

5. Side/Rear monitor elevation and aiming

Aim horizontally side and rear monitors as follows:

- monitor particularly close to the CMA are simply aimed perpendicularly to CMA sides;
- aim the other monitors to the CMA vertex, checking that their aiming projection line doesn't fall "beyond" the sweet spot: if that happen aim the relative monitor to the sweet spot itself.

Lastly, aim vertically each side/rear monitor to the sweet spot by looking at vertical section passing through the sweet spot itself and the acoustic center of the monitor considered

6. Ceiling monitors placing and aiming

- On the horizontal plan, draw at least two straight line parallel to room longest dimension and bounded in between the two most spreaded apart front monitor: the ceiling speaker will be then placed on those lines at longitudinal distances corresponding to the side monitors horizontal positions.

6. Ceiling monitors placing and aiming

- Ceiling monitor elevation is unique and determined by looking at a vertical section view, parallel and oriented to the rear wall and comprehensive of the monitor closer to 1/3 room length.
- Monitors height is then obtained by the intersection of previously defined longitudinal reference lines and the line forming an angle, where E is the angle formed in section view by joining the sweet spot to the side monitor acoustic axis closer to 1/3 of room length.

Note that in case resulting elevation is too high the most straightforward solution is to move closer to the room center the ceiling monitor horizontal reference lines – but still checking that ceiling tilting angles are adequate!

GPublisherVersion 3.0.100.100

Multichannel Audio Standards

Multichannel Audio Standards

- A. ITU-R BS 775-3 "Multichannel stereophonic sound system with and without accompanying picture" (Geneva, 2012)
- B. ITU-R BS 1116-1 "Methods for the subjective assessment of small impairments in audio systems including multichannel sound systems" (Geneva, 1994-97).
- C. ITU-R BS.2159-7 "Multichannel sound technology in home and broadcasting applications"
- D. AESTD1001.1.01-10 "Multichannel surround sound systems and operations"
- E. SMPTE RP-173, "Loudspeaker placements for audio monitoring in high definition electronic production," Rec., SMPTE N 15.04/152-300B, Society of Motion Picture and Television Engineers (1991).
- F. EBU Tech 3276-E "Listening conditions for the assessment of sound programme material"(2004).
- G. SMPTE ST 202:2010 - SMPTE Standard - Motion-Pictures — Dubbing Theaters, Review Rooms and Indoor Theaters — B-Chain Electroacoustic Response

5.1 – ITU-R BS 775-3

Reverberation time

$$T_m \approx 0.25 (V/100)^{1/3} \text{ [s]}$$

so for 100 m³ room is 0.25 s

Figure 3. Tolerance mask for reverberation time, relative to arithmetic average value T_m . (Based on international recommendations, but extended to lower frequencies, with smaller tolerances in the range of 63–125/200 Hz.)

AESTD1001.1.01-10

Frequency response mask

±3 dB

possible slope for HF

Figure 4. Tolerance limits of operational room response curve, relative level. (Based on international recommendations but extended to lower frequencies.)

SMPTE X Curve

1. The X-curve is not an equalization/target curve. Rather, it is a response that shows up if you measure a loudspeaker with flat response, in a large room with a real-time analyzer and pink noise as specified in the standard. And that such a measurement will tend to show a decline in frequency response starting around 2 kHz at a rate of 3 dB per octave.
2. Since the X-curve is a measurement error, it is not a “target curve” in the sense of trying to modify the sound. That is, the goal is to get at flat response and compensate for the measurement error.
3. The reason behind the measurement error is the inclusion of the reverberations in the room. That is, when the direct (“on-axis”) sound of a flat response speaker is combined with reflections/reverberations in the room, the high frequencies when measured continuously using Real-Time Analyzer (RTA) and pink noise. There is also an effect stated to be there in low frequencies.

NOTE – Tolerances are based upon 1/3-octave measurements. If 1/1-octave measurements are used, reduce the tolerance by 1 dB.

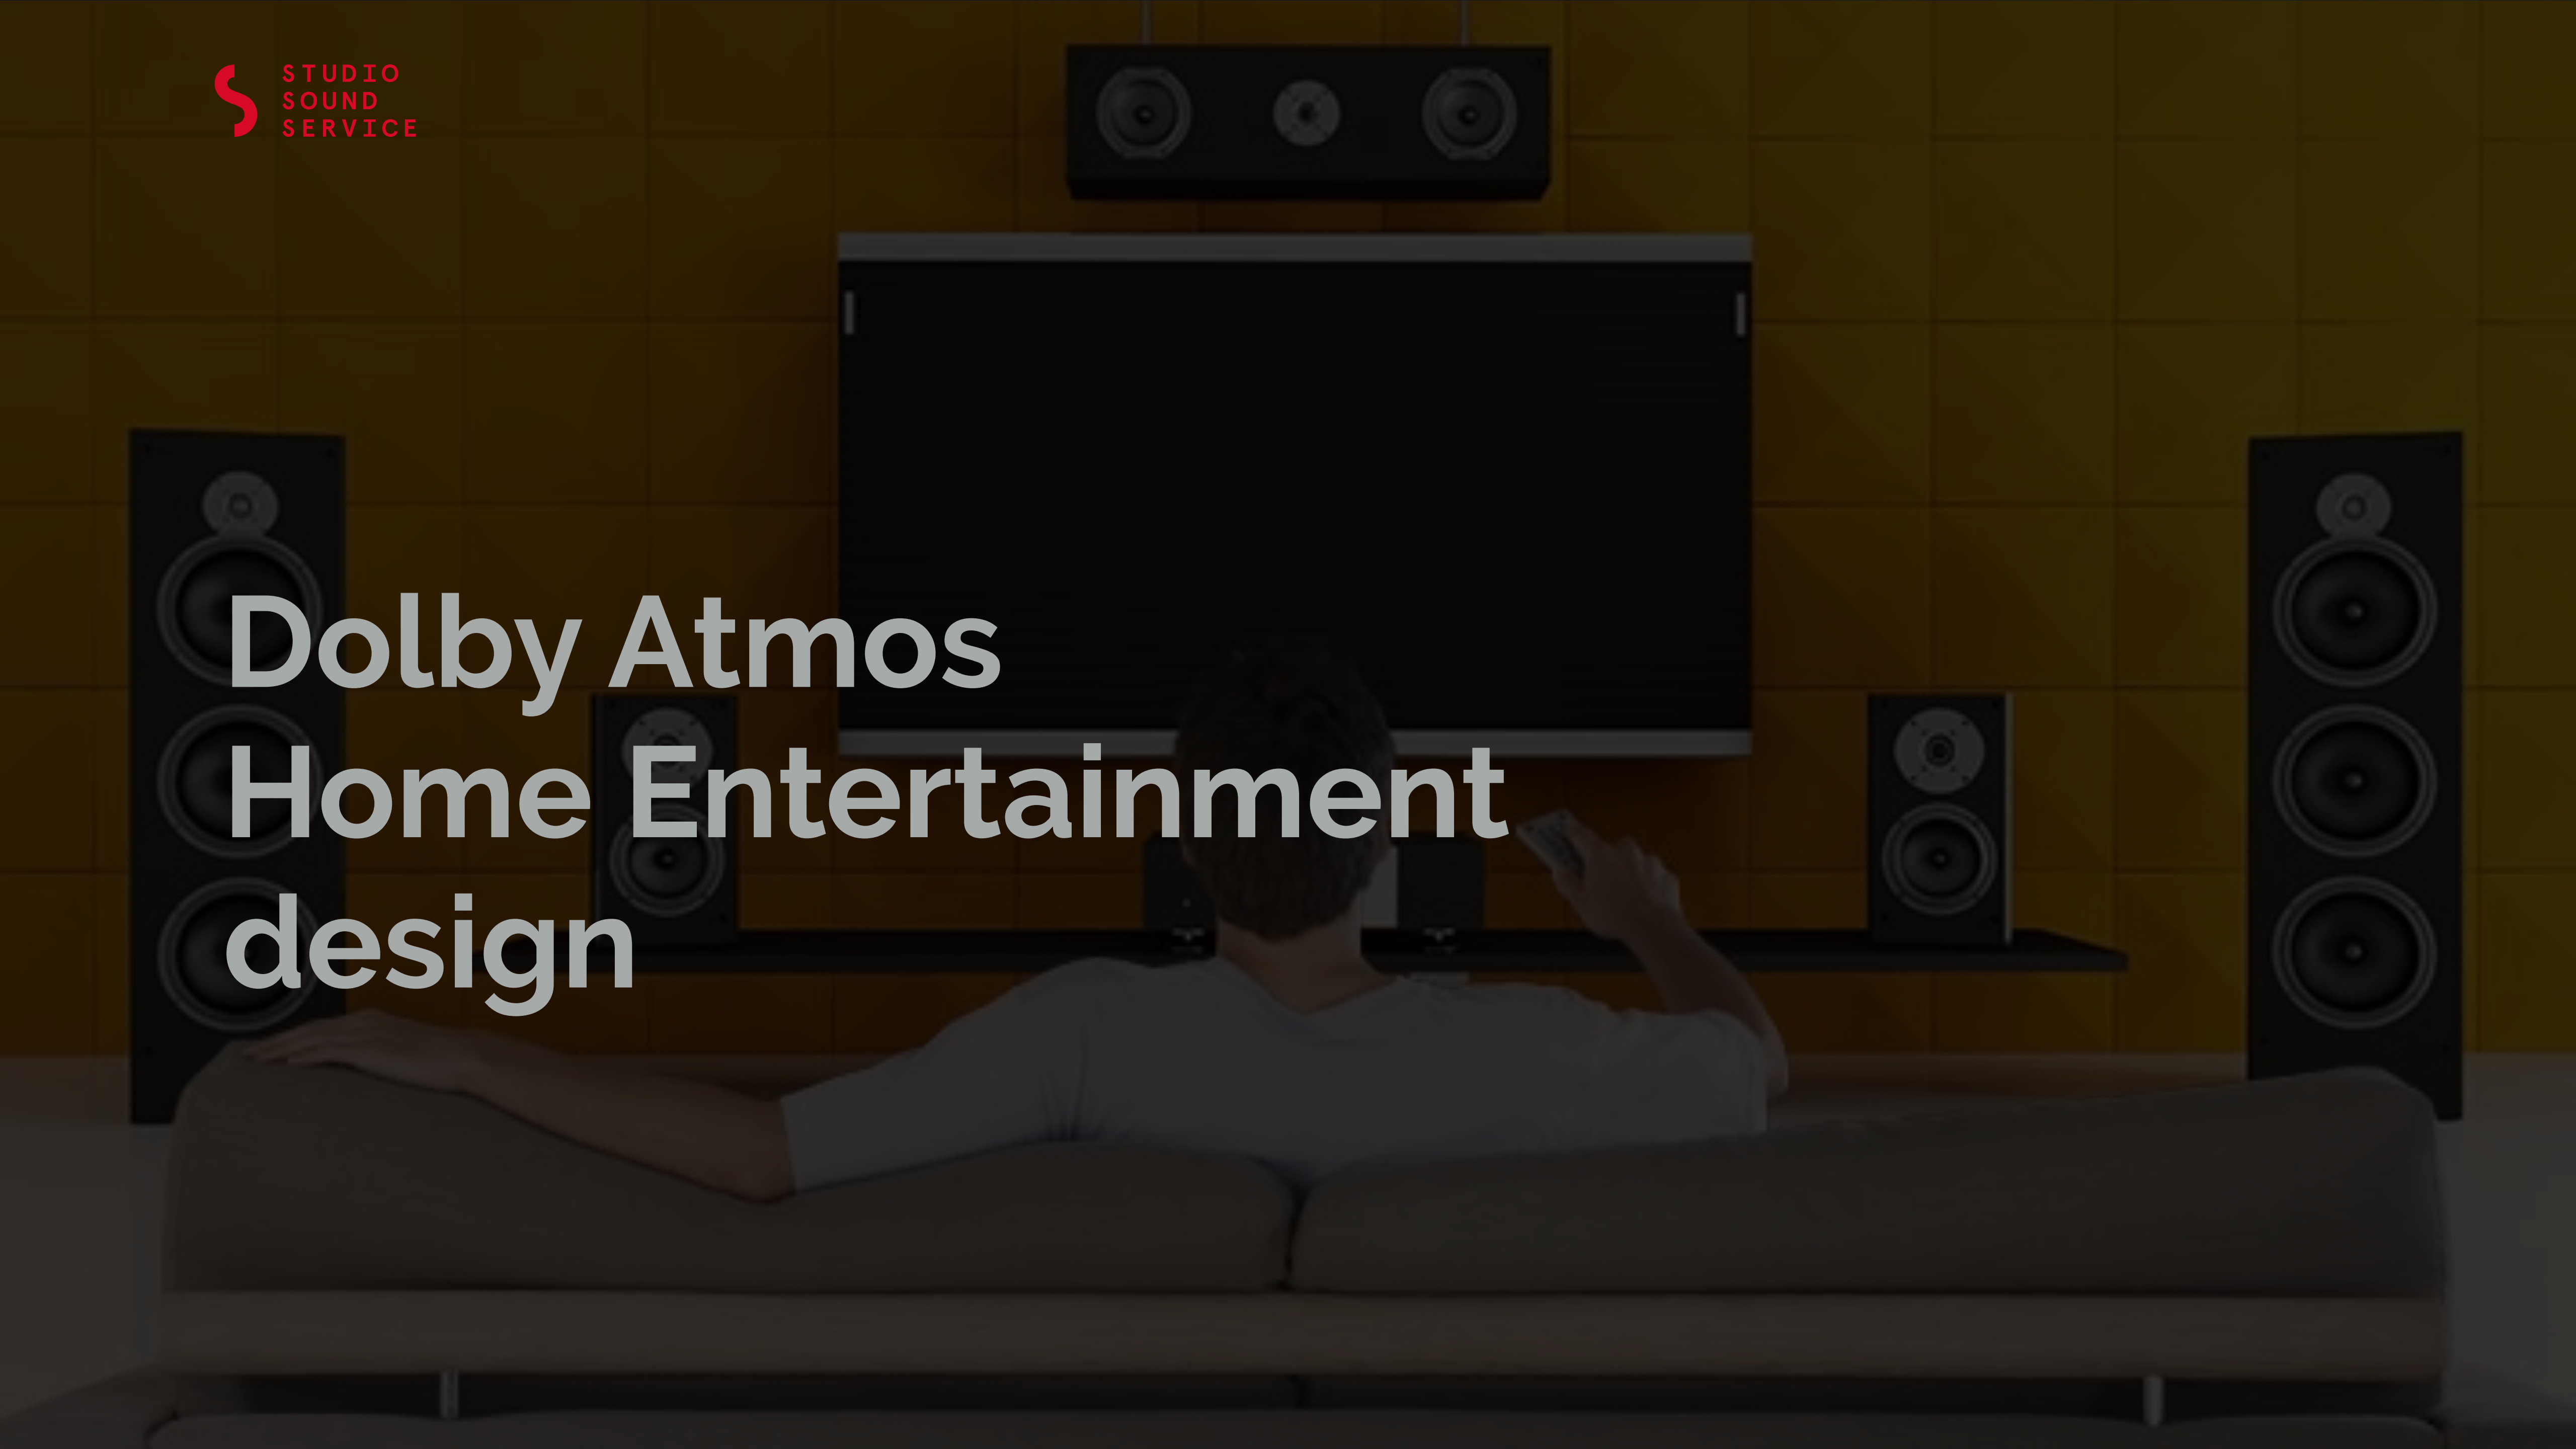

Figure 18 - SMPTE 202M – 1998 – X-Curve extended to 16 kHz with second break point at 10 kHz

How do standards evolve?

has the public become more critical with the evolution of increasingly complex multi-channel systems?

- A. Joining scientific aspects and consumer expectation might result tricky: still, it is important to consider both!!!
—> **the standard as a design prerequisite and a consumption model**
- B. standards have been consolidated with respect to technology innovation and the gradual change in public audience expectations and competence
- C. first implementations of such reproduction standards referred to Cinema application, while nowadays surrogate configurations and pro-ish equipments could actually reach private houses at relatively cheap prices – such perspective is becoming more and more popular, implying that dedicated standards, studios and contents are increasingly required.

Dolby Atmos Home Entertainment design

Dolby Atmos Home Entertainment Requirements

- A. Room Volume > 28 m³
(> 3.6x3.3x2.4 m)
Room > 58 m³ may be more practical!!!
- B. Acoustic treatment like a control room.
- C. If you use up-firing speakers, ceiling must be reflective.

Dolby Atmos Home Entertainment Requirements

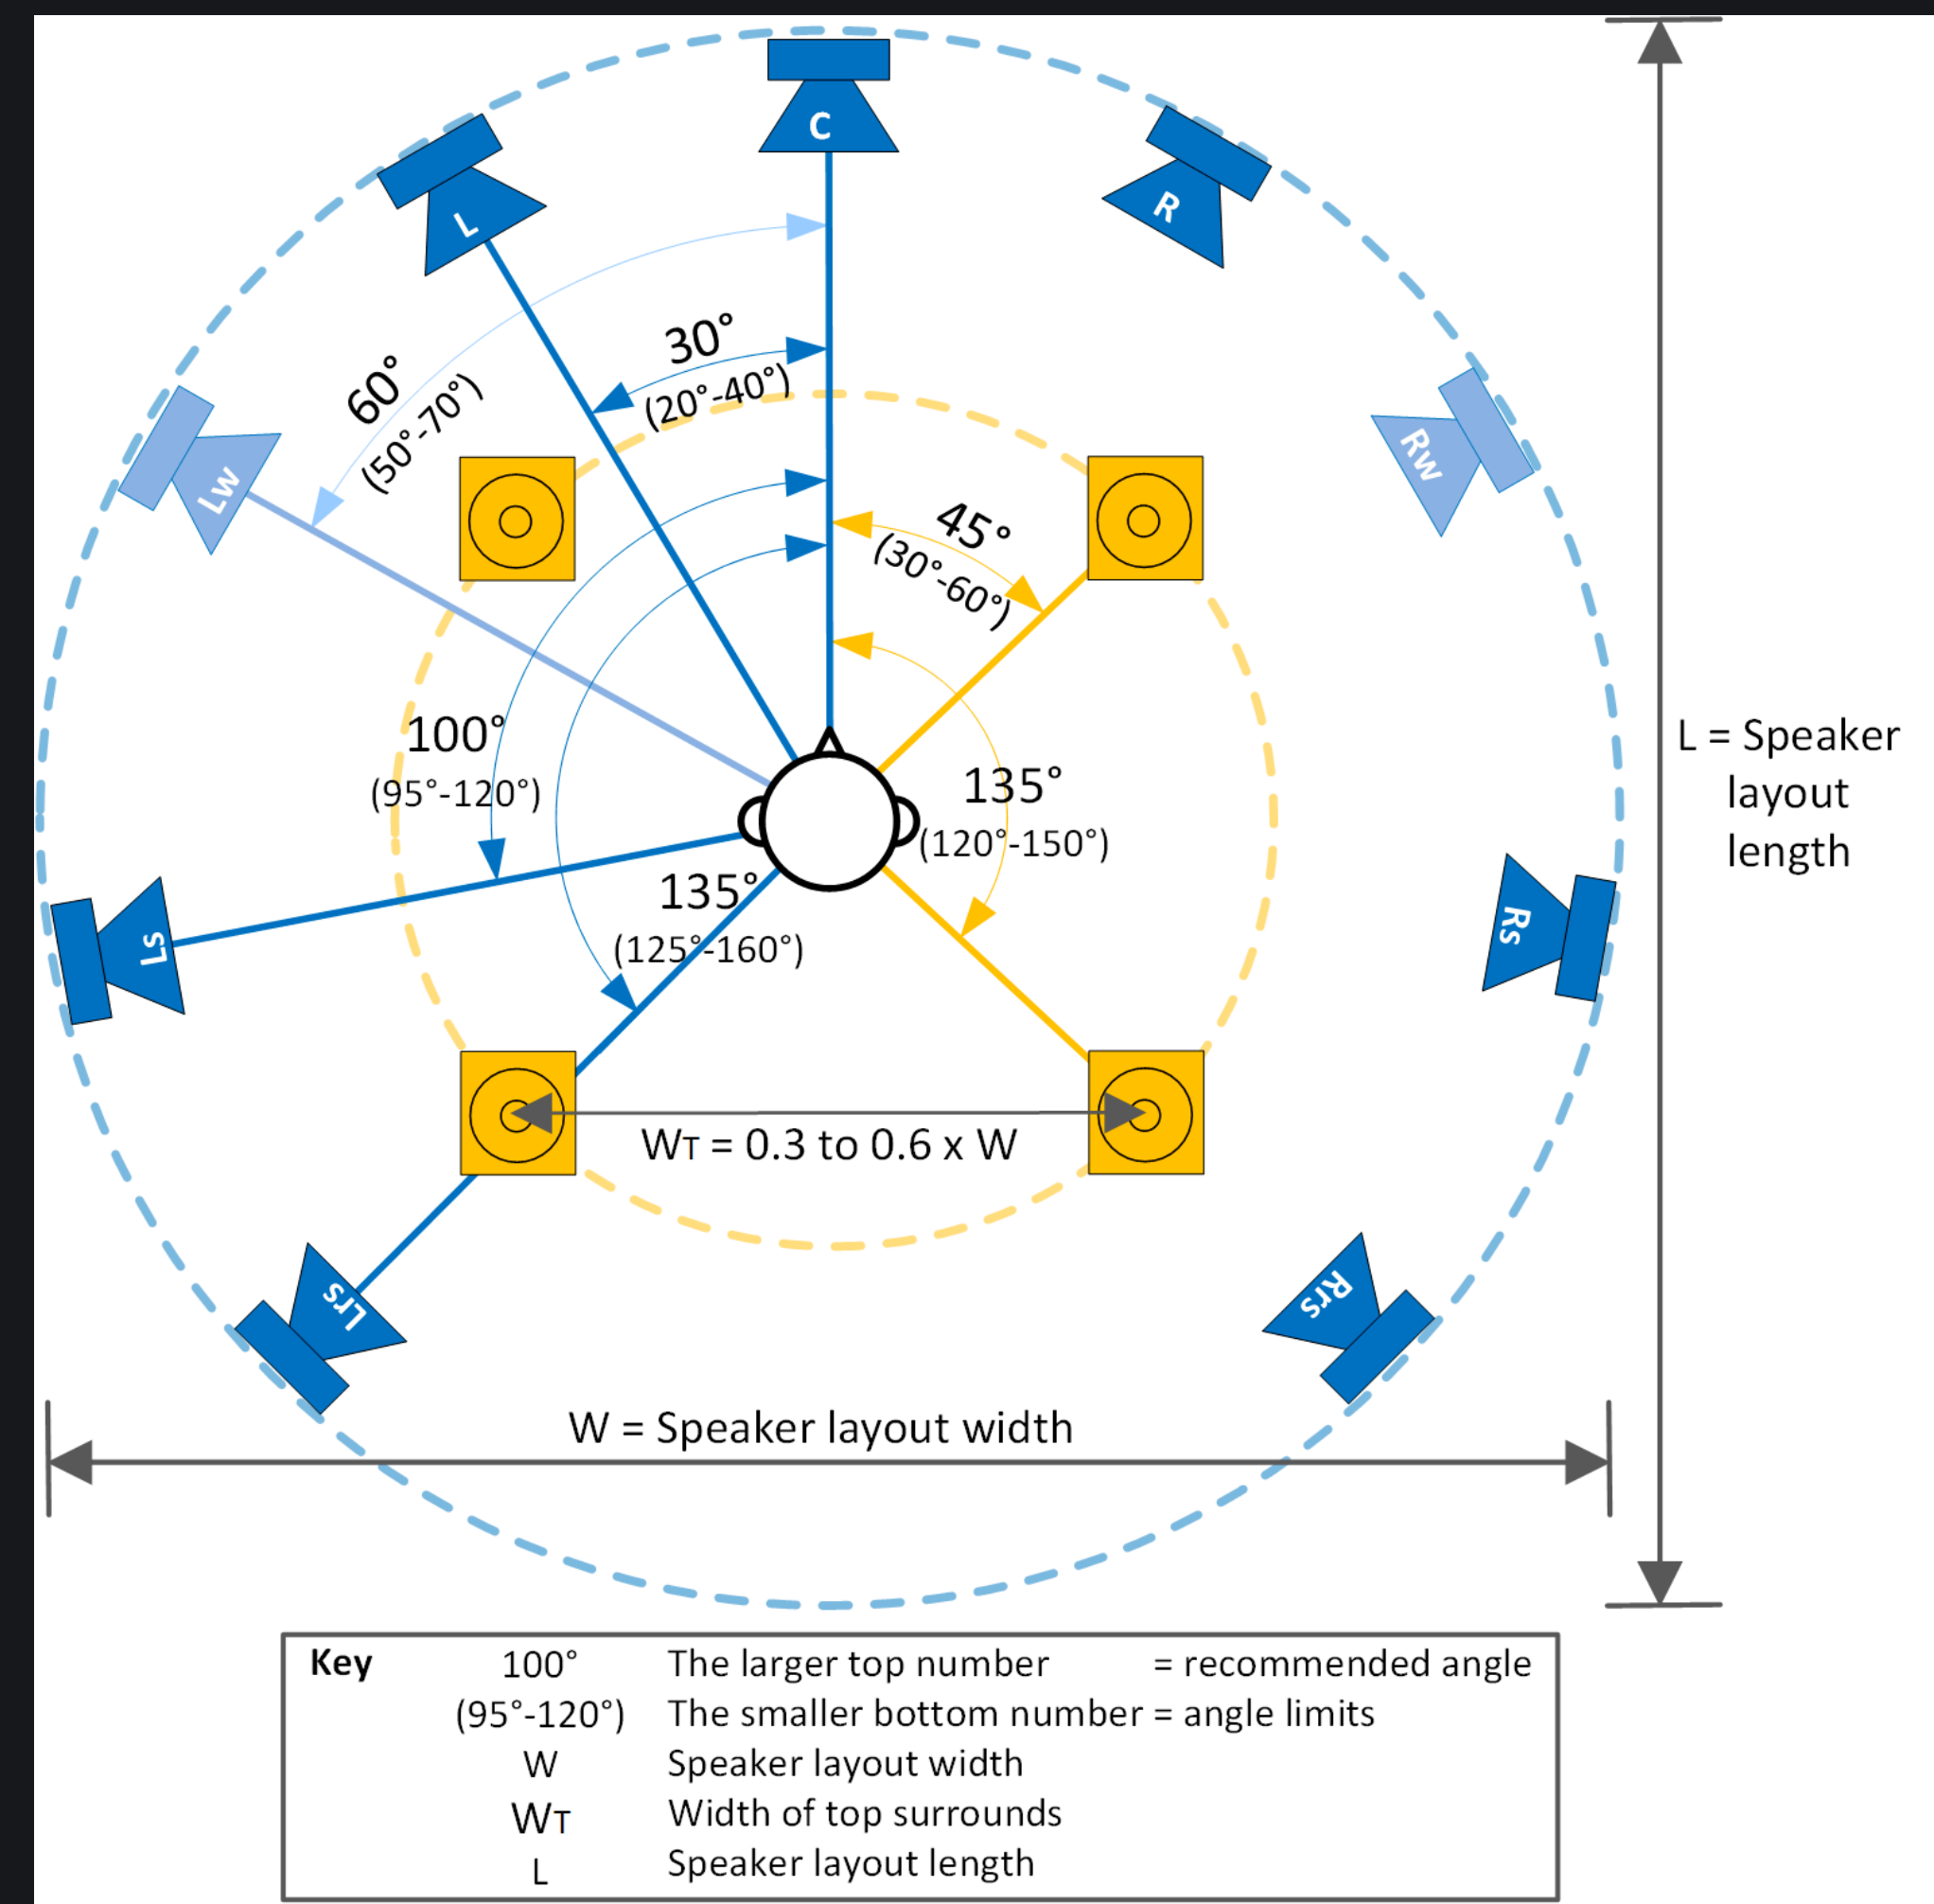

- A. Room Volume > 28 m³
(> 3.6x3.3x2.4 m)
Room > 58 m³ may be more practical!!!
- B. Acoustic treatment like a control room.
- C. If you use up-firing speakers, ceiling must be reflective.

 DARDT Excel file from Dolby with specs
(Dolby Atmos Room Design Tool)

Dolby Atmos Home Entertainment Arrangement of Speakers

- A. Basing on **ITU-R 775-3**:
- LCR 30+30°
 - Ls 100° (95÷120)°
 - Lrs 135° (125-160)
- B. Speakers equidistant from the listening position, but this is not always possible.
—> delay and level calibration

→ ITU standards are closer to the consumer experience so Dolby uses them for HE arrangement

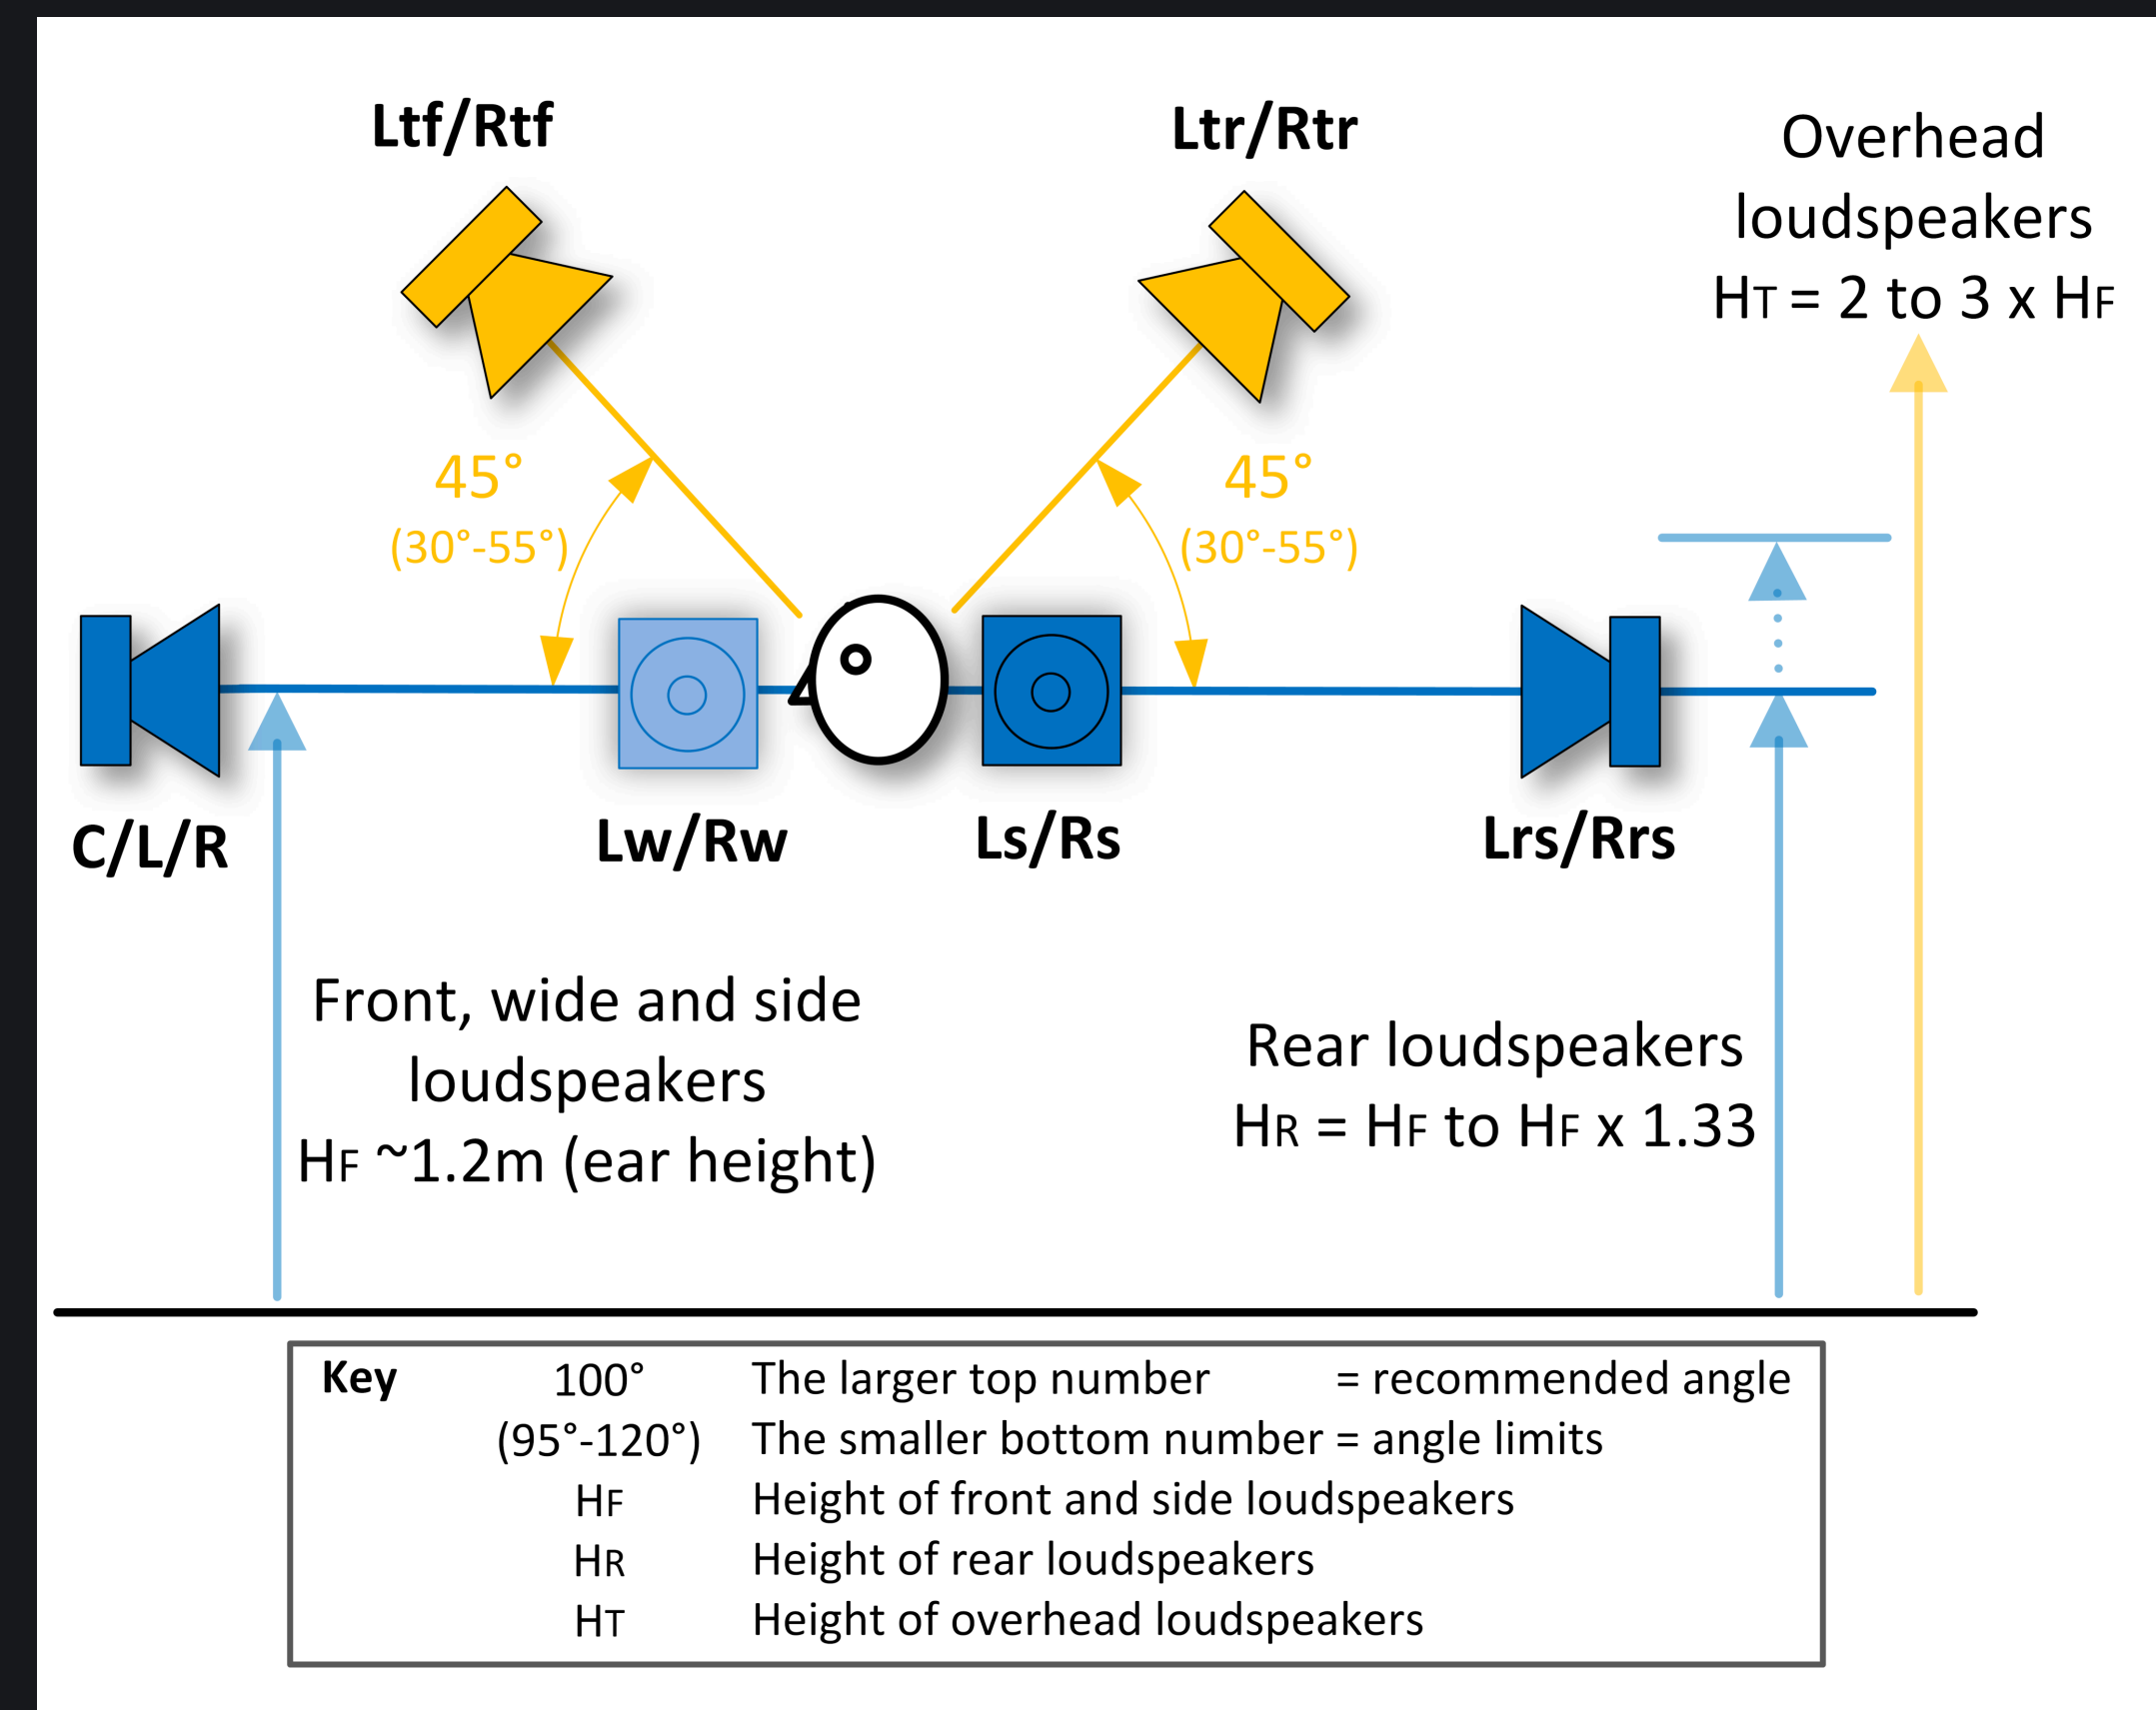

Dolby Atmos Home Entertainment Arrangement of Speakers

A. Speakers height (ITU-R BS 1116-1):

- LCR + Ls/Rs \rightarrow (H_F)
at ear-level (120 cm), *if possible*
- Lrs, Rrs \rightarrow (H_R)
at ($H_F \div H_F \times 1.33$) so (120÷160 cm)

B. Ceiling speakers:

- the overhead side-to-side separation should be 0.3 to 0.6 of the width W of the overall layout.
- the height H_T must be 2 ÷ 3 times the floor speaker height H_F (*i.e. 240-360cm*).
- the angle towards the listening point must be 45° (*adjusted 30÷55*)°.

Dolby Atmos Home Entertainment Calibration

- A. Calibration from 79 to 82 dB (C) with a pink noise RMS at -20 dBFS for Game: 75 dB
- B. each speaker must be calibrated to 79 dB(C) and each speaker must be able to play 99 dB(C) at the listening point with a 102 dB(C) option for rooms that need more headroom.
- C. LFE +10 dB *ITU-R BR-1384*
- D. Calibration and Target Curve:
 - **room bigger than 125 m³**
SMPTE 202: 2010 X-Curve ± 3 dB (100÷16k) Hz
 - **room smaller than 125 m³**
the X-Curve slope 2kHz may be reduced or the knee-point may be moved up to 4 kHz, 8 kHz or even higher in some cases

CHALLENGE

2015
Fox Networks UK

A challenge:
little space and proximity

1

The binoculars revolution

The room shape we invented (to best occupy all the space) was similar to binoculars, with two perfectly symmetrical rooms that share the Vocal Booth.

2

The basic geometry

the geometry is optimized in order to keep the rooms with the necessary listening systems in the smallest possible space and to offer the best sound experience.

3

The entrance room

The Entrance Room increases privacy for processing and further separates the audio rooms from the open office.

Layout

Critical issues

Historic building in the center of Rome.
Four rooms very close to each other, important
acoustic insulation.
Set the geometries between the possible spaces.

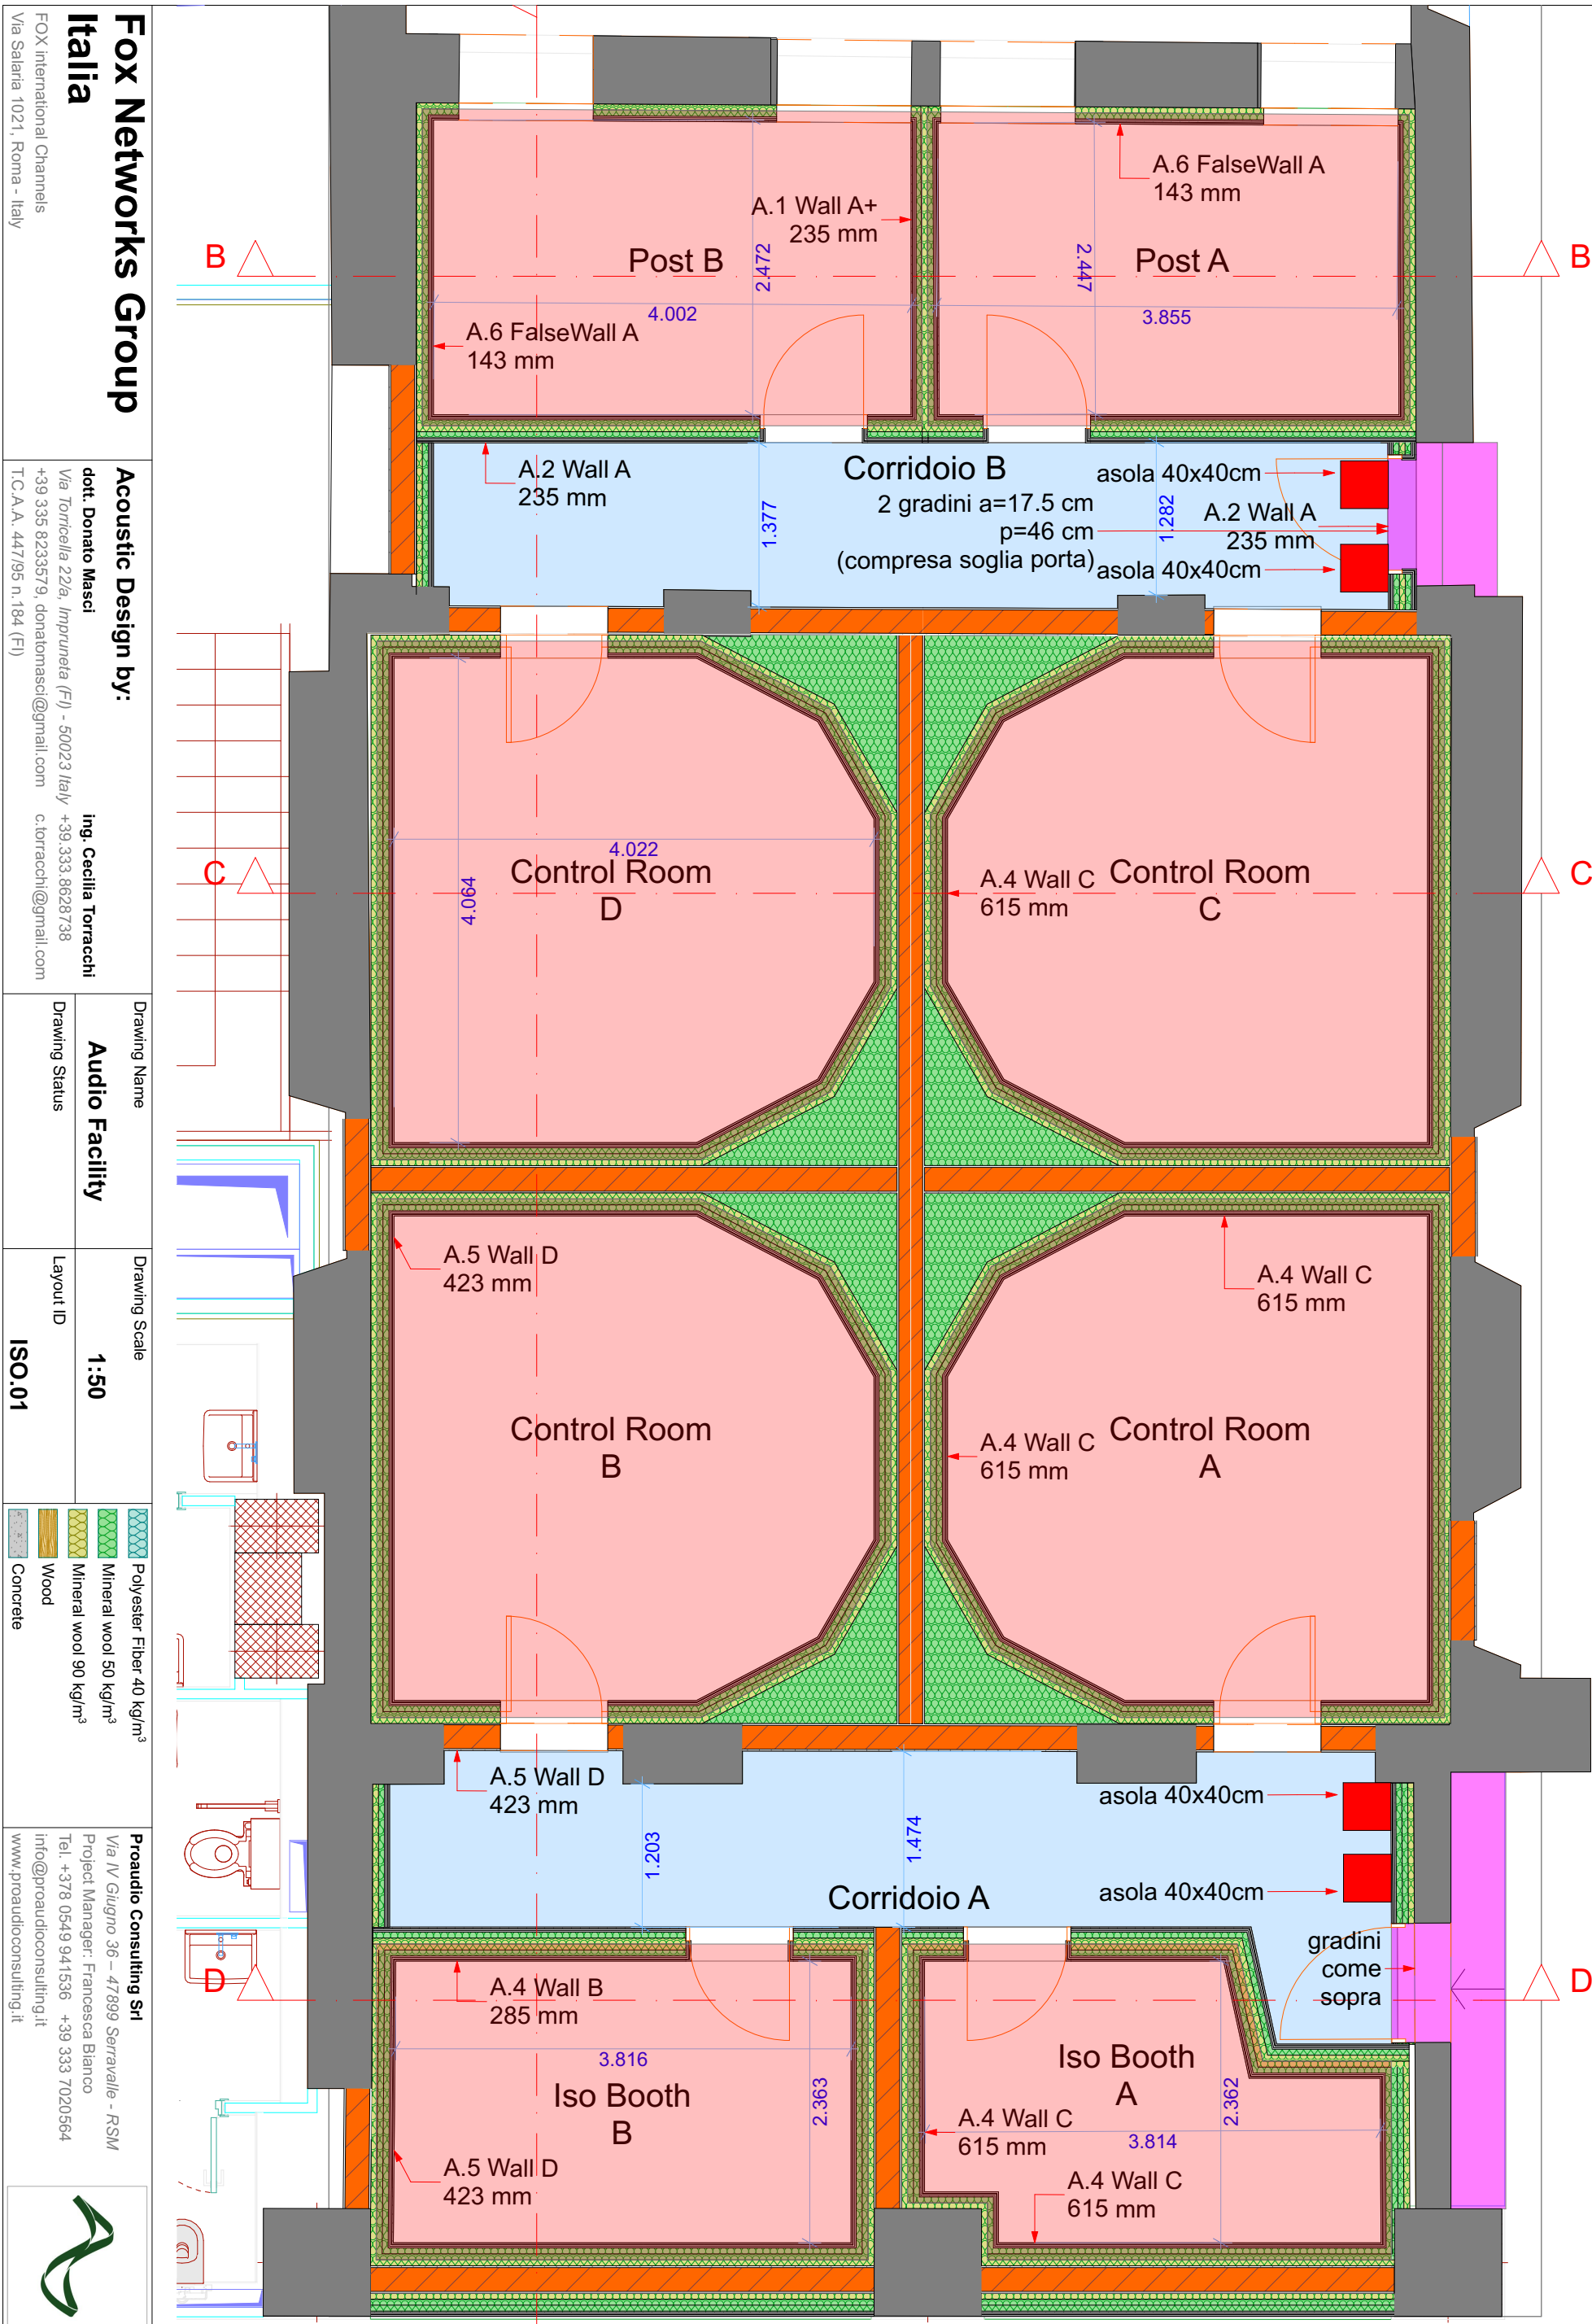

Division of spaces

Keep the shape of the Fox room but insert it in a
very complex context for divisions, columns etc.
creation of two areas with independent access
corridors (sound lock).

Functional choices

Use of a hybrid insulation system, masonry +
plasterboard.
Dolby Atmos listening system.

Bel design italiano.

1945 - 1965: Bel Design italiano

Since 1948, as noted by François Burkhardt (2011 International Golden Compass Award):

«The intellectuals lost the battle with the elections of 1948, and with them the possibility of a change in land laws and a reorganization of the community, the architects shifted their attention to the object itself, which then became a bearer of meaning and orientation.»

It is from this year that Made in Italy begins to know its success internationally.

Combining with the style of the facility.

Collaboration with the FOX design team for the complete integration of our ideas in the context of offices.

Conclusions

Problems found in practice about Dolby Home Entertainment design:

*basic rules of acoustics might
apply to every kind of control
room, but issues arise depending
on the required integration
between audio and video*

- A. **Door position:**
if the surrounds have to be at about 120÷150 cm height, the door position is a problem (this was not a problem for cinema mixing room because the surrounds are generally higher).
- B. **TV LCD vs. Projection screen:**
how to integrate front speakers with the screens?
upper or lower?
side within the image or outside of it?
- C. **1/3 or 2/3 of the room length?**
these points came from the room acoustics (better room modes distribution), but the choice depends also on room functionality:
 - > 1/3 music studios (also soundtrack composers)
 - > 2/3 only mixing (cinema & broadcast)

Conclusions:

- A. Standard have been consolidated with respect to technology innovation and the relative change in public audience expectations and competence.
- B. Multichannel and immersive audio:
 - too many speakers for home!!!
soundbar and up-firing speakers are a good solution for the consumer, calibration needed (!)
 - up-firing vs down-firing:
up-firing —> sustained ambiance feeling
down-firing —> precise origin of sound

—> different up-firing and down-firing studios to mix and master the contents?

Open Questions:

- A. What consumer shall expect from industry in coming years?
- B. Is the immersive/multichannel audio only for Cinema and TV?
- C. Is the Music Industry able/interested to follow?

... if not, will the audio production be different between music and general motion picture application?

Thank you!
